	YearOfCentury(t1, 1866)		
	t1 < now		
dynamite.n.01	(x2)		

Meaning preserving translations

# Objectives of the PMB project

- Parallel corpus annotated with formal meaning representations
- Semantic tools for languages other than English
  - One system with language-specific models
- Learn more about (cross-lingual) compositional semantics
  
- Study translations from a formal semantic perspective
- Improve translations

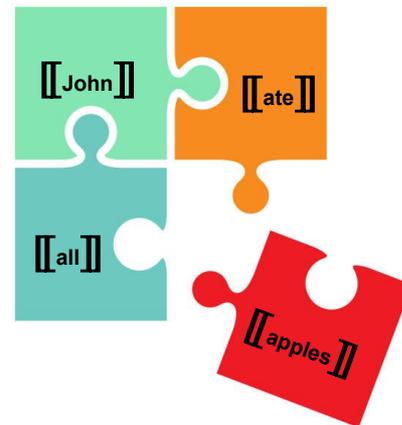

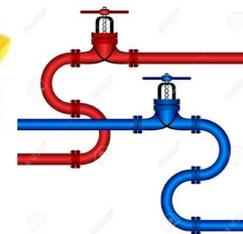

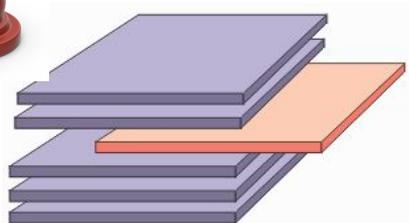

# Design of the PMB

- Several (but not too many) annotation layers
- Collaborative annotation:
  - Machines
  - Experts
  - The crowd
- Distinguish Bronze/Silver/Gold annotation layers

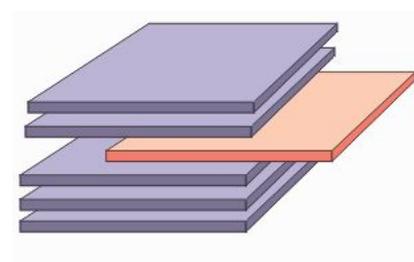

# Plan

Universal  
Semantic Tagging

# Language-neutral annotation layers

- Segmentation
- Semantic tagging (~~part-of-speech tagging~~)
- Symbolization (~~lemmatization~~)
- Word sense disambiguation (Wordnet 3.0; Miller, 1994)
- Semantic role labeling (Verbnet roles; Bonial et al, 2011)
- Syntactic parsing (Combinatory Categorical Grammar)
- Semantic parsing (Discourse representation theory)

# Segmentation (challenges)

- Split texts into sentences
  - John said "I won't go. I am lazy".
- Split sentences into "meaningful atoms/words"
  - San Diego, Secretary of State, Royal Bank of Scotland, ...
  - baseball club, knitting needles, pair of scissors ...
  - unhappy, impossible, disagree, ...
  - ten-year-old, data-driven, New York-based ...
  - as well as, instead of, again and again, ...

# Semantic parsing

with Discourse Representation Theory (DRT; Kamp & Reyle, 1993)

Difference with Kamp's DRT:

- Projective DRT (Venhuizen, 2015)
- Neo-Davidsonian event analysis
- No analysis of plurals yet
- Just three tenses (no aspect)
- WordNet synsets as concepts
- Presupposition as anaphora (van der Sandt, 1993)

Discourse representation structures has:

- Logical symbols: comparison & Boolean operators, and variables
- Non-logical symbols: concepts, relations, and normalizations

x1	x2	e1	t1
male.n.02(x1)

# SEM tags for semantics

- Schema of lexical semantics is determined by a sem-tag and a syntactic category  $\langle \text{SEM}, \text{CAT} \rangle$
- Less sensitive to syntax (vs POS tags)
- Semantic info complements thematic roles, syntax and *lemma*.
- Generalizes over POS tags and Named Entity classes

# UNIvesral SEemantic Tagset

- 73 sem-tags divided into 13 classes
- Under development (v0.7)
- Designed in a data-driven fashion (EN, NL, IT, DE)

Attribute

**QUC** Concrete quantity

two, six million, twice, 5 millions, many, enough

**QUV** Vague quantity

**COL** Colour

red, crimson, light\_blue

**IST** Intersective

open, vegetarian, quickly

**SST** Subjective

skillful surgeon, tall kid

**PRI** Privative

former, fake

**DEG** Degree

2 meters tall, 20 years old

**INT** Intensifier

very, much, too, rather

**REL** Relation

in, on, of, after

**SCO** Score

3-0, grade A

Anaphoric

PRO

Anaphoric & deictic pronoun

DEF

Definite

HAS

Possessive pro.

REF

Reflexive & reciprocal pro.

EMP

Emphasizing pro.

he, she, I, him

the, lo<sup>IT</sup>, der<sup>DE</sup>

my, her

blamed herself, each other

left himself

<b>NTH</b>	Other names	table 1a, equation (1)

# Tagging & Semantics

Formal compositional semantics are less favoured:

- Semantics problems
- Difficult to scale up

Make a study of formal semantics modular

NLP community loves tagging/labeling tasks

- Conceptually a simple task
- Create an annotated data
- Employ ML techniques for learning

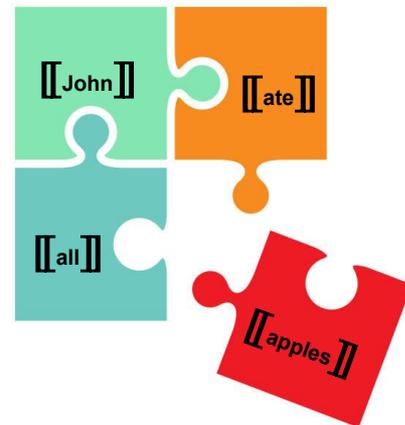

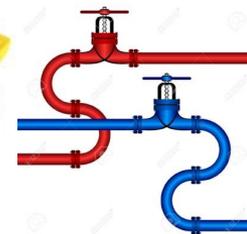

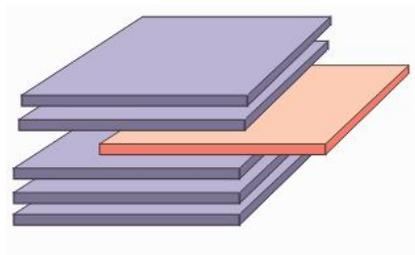

# Language-neutral annotation tools

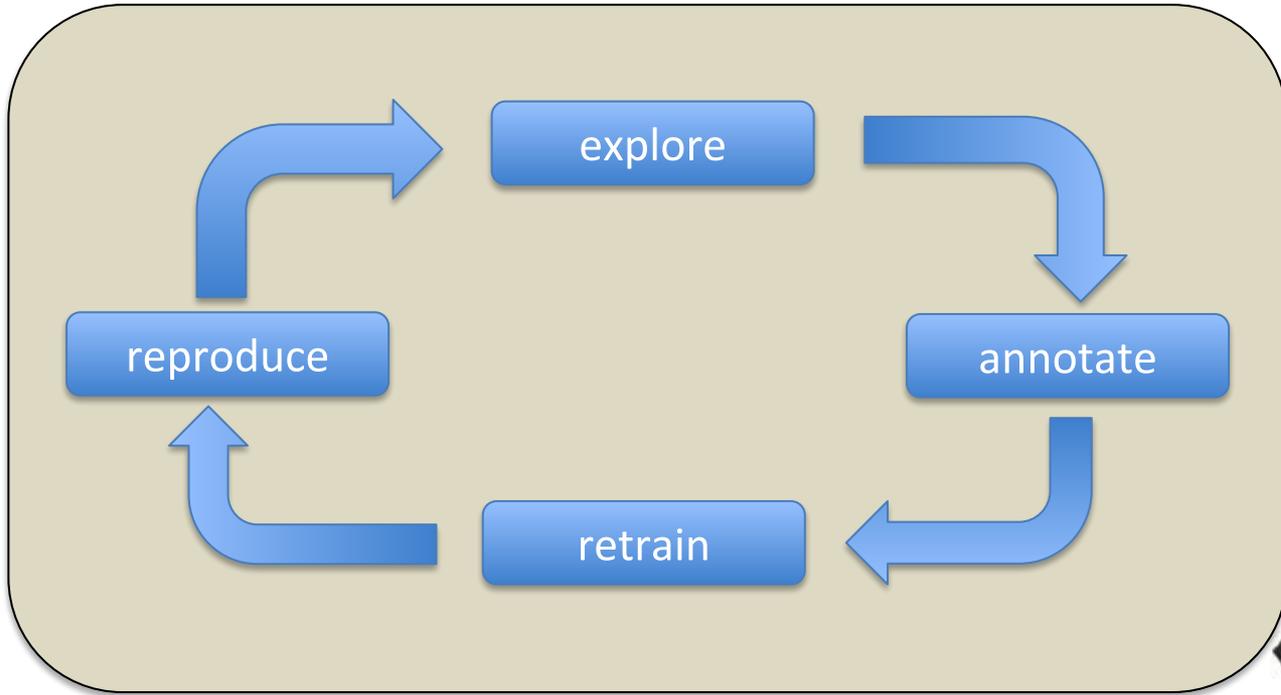

- Segmentation: **elephant** (Evang et al., 2013)
- Symbolization: **baseline** (conditioned unigrams)
- Word sense disambiguation (Wordnet 3.0): no
- Semantic role labeling (Verbnet roles): no
- Syntactic parsing: **EasyCCG** (Lewis & Steedman, 2014)
- Semantic parsing with DRT: **Boxer** (Bos, 2008; 2015)
- Semantic tagging: **TnT tagger** (Brants, 2000) with 93% accuracy for EN

# Plan

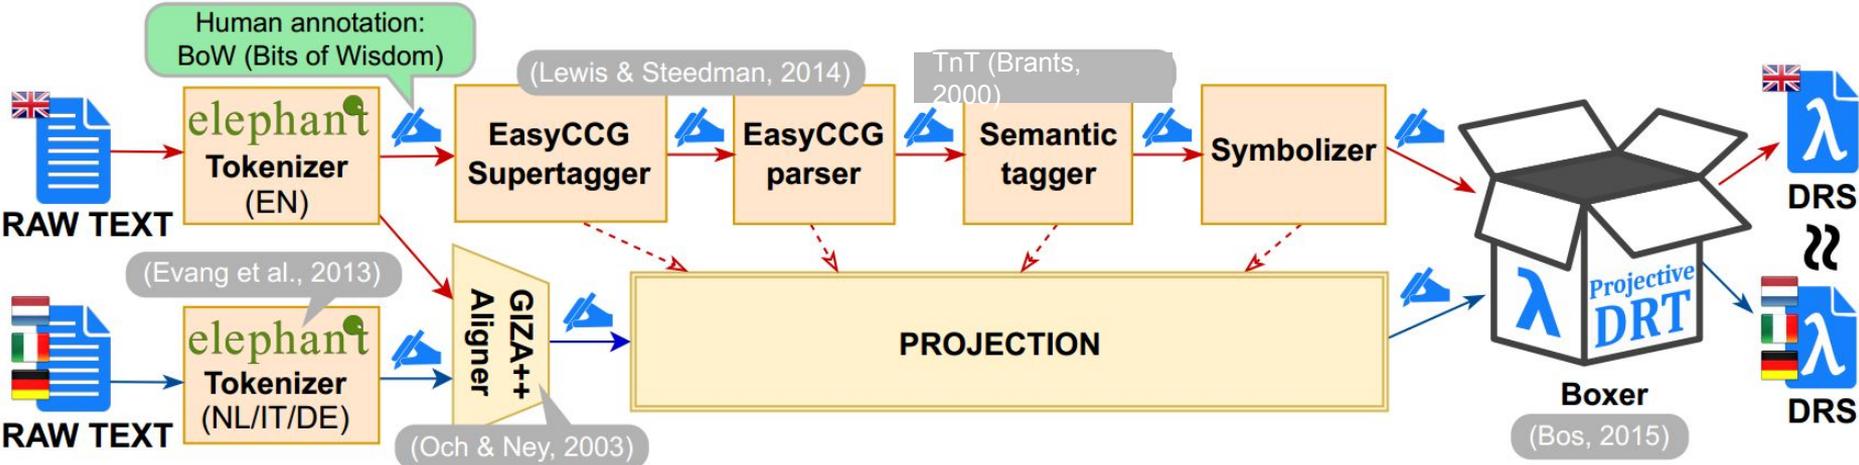

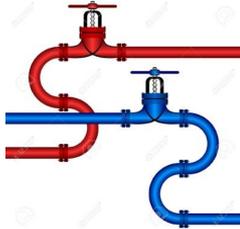

Universal  
Semantic Tagging

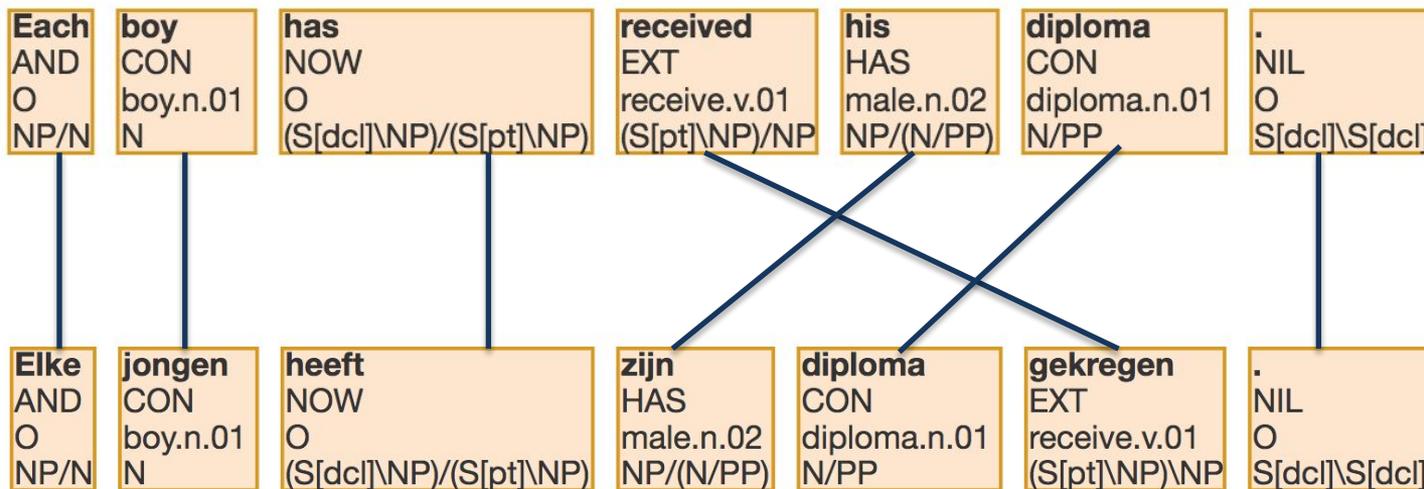

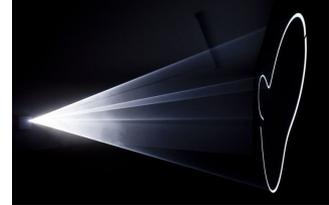

# Semantic Annotation: the REAR cycle

# The PMB pipeline

# Projection: EN → NL (PMB 19/0830)

see: **Evang & Bos (COLING 2016)**

# Copy, Merge, Split

- **Copy:**  
transfer of category from source to target
- **Merge:**  
two source categories merge into one target category (composition)
- **Split:**  
one source category into two target categories (de-composition)
